ABSTRACT

Background: The prevalence of diabetes mellitus (DM) have tripled from 1980 till date as a result of many factors of which obesity/excessive weight gain is a closely related factor of DM. There are many adverse challenges of DM in pregnancy with its associated fetal and maternal consequences.

Aim: To determine the prevalence of DM in pregnancy amongst antenatal clinic (ANC) at booking at the Rivers State University Teaching Hospital (RSUTH).

Methods: It was a cross sectional study of ANC attendees at booking at the RSUTH. Simple random sampling method was used. The Information was coded and analyzed using SPSS version 25.

Results: A total of 99 pregnant women were recruited at booking in the ANC of the RSUTH. The mean age was 32.2 years and the modal parity was 1.0. The number of ANC attendees with weight equal to or greater than 90 Kg were 21 (21.2%), number with weight greater than equal to 90 Kg with glucose in urine were 10 (10.1%) Three (3.0%) of the subjects were known diabetic whereas 12 (12.1%) had family history of DM.

Conclusion: The study revealed the prevalence of DM amongst ANC attendees at the RSUTH as...
3.0%. There was corresponding glycosuria in 10.1% of the ANC attendees. ANC attendees had family history of DM were 12.1%. Advocacy is needed to educate the populace on the predisposing factors of DM and its adverse effect on maternal and child health.

Keywords: Prevalence; DM; ANC attendees; RSUTH.
